APPENDIX

Experiment Reproducibility Evidence

BlackMess PQC Research | Version 4.0 BSI Edition
BlackMess Research Team — Ternate, North Maluku, Indonesia
April 2026 | Prepared for: BSI Germany, TU Darmstadt, RUB Bochum, TU Berlin

This appendix contains visual evidence that all nine experiments reported in the main paper were executed on real commodity Android ARM hardware (Termux environment, Python 3.12.12, liboqs 0.15.0) — not on server infrastructure. Screenshots are unmodified terminal output captured directly from the research device.

Appendix	Content	Script	Result
A	RSA vs ML-KEM Benchmark	benchmark_pqc.py	KeyGen 673x faster
B	PQ MFA Simulation	pq_mfa_simulation.py	SIGNATURE VALID
C	Hybrid KEM E2EE	pq_hybrid_kem.py	Keys match: True
D	Replay Attack Prevention	pq_replay_prevention.py	4/4 blocked
E	PQC Secrets Vault	pq_secrets.py	7/7 protected
F	Key Rotation Protocol	key_rotation_protocol.py	14 audit entries
G	NIST Property Verification	nist_test_vectors.py	FIPS 203/204 PASS
H	Side-Channel Analysis	side_channel_analysis.py	Report saved
I	Threat Model Generator	threat_model_generator.py	7/8 MITIGATED

TABLE A.1: Summary of all experiment scripts and results — all executed on Android ARM (Termux)

Appendix A — RSA-3072 vs ML-KEM-1024 Benchmark

Script: benchmark_pqc.py | 50 iterations | Platform: Android ARM, Termux, Python 3.12.12

This screenshot shows the raw terminal output of the RSA-3072 vs ML-KEM-1024 (Kyber-1024) benchmark. Key finding: ML-KEM-1024 key generation is 673x faster than RSA-3072 (2.304 ms vs 1,550.736 ms). All operations confirm quantum-safe advantage of ML-KEM.

Key results visible in output: KeyGen 673x faster | Encap 1.3x faster | Decap 6.3x faster

BlackMess PQC Research
Benchmark: RSA-3072 vs Kyber-1024
Iterasi per algoritma: 50

==================================================
RSA-3072 (Algoritma Klasik)
==================================================
  Key Generation : 1550.736 ms (min: 306.345 ms)
  Encryption     : 2.5720 ms
  Decryption     : 18.4080 ms
  Ukuran Public Key: 384 bytes

==================================================
Kyber-1024 (Post-Quantum / NIST Standard)
==================================================
  Key Generation : 2.304 ms (min: 0.862 ms)
  Encapsulation  : 1.9212 ms
  Decapsulation  : 2.9053 ms
  Ukuran Public Key: 1568 bytes

==================================================
HASIL PERBANDINGAN
==================================================

  Key Generation:
    RSA-3072  : 1550.736 ms
    Kyber-1024: 2.304 ms
    → Kyber 673.0x lebih CEPAT

  Encryption/Encapsulation:
    RSA-3072  : 2.5720 ms
    Kyber-1024: 1.9212 ms
    → Kyber 1.3x lebih CEPAT

  Decryption/Decapsulation:
    RSA-3072  : 18.4080 ms
    Kyber-1024: 2.9053 ms
    → Kyber 6.3x lebih CEPAT

  Ukuran Public Key:
    RSA-3072  : 384 bytes
    Kyber-1024: 1568 bytes
    → Kyber 4.1x lebih BESAR

==================================================
KESIMPULAN RISET
==================================================

  Kyber-1024 (Post-Quantum) vs RSA-3072 (Klasik):
  - Key generation Kyber jauh lebih cepat
  - Encryption/Encapsulation Kyber lebih efisien
  - Trade-off: ukuran kunci Kyber lebih besar
  - Kyber AMAN dari serangan komputer kuantum
  - RSA RENTAN terhadap algoritma Shor di komputer kuantum

  Kesimpulan: Untuk sistem perbankan modern (OJK/BI),
  migrasi ke Kyber-1024 memberikan keamanan jangka
  panjang dengan performa yang lebih baik.

~/riset/khusus $
```

Figure A.1: benchmark_pqc.py — RSA-3072 vs Kyber-1024, 50 iterations, Android ARM (16:52 WIT, April 1 2026)

Appendix B — Post-Quantum MFA Simulation

Script: pq_mfa_simulation.py | 5-stage authentication flow | ML-DSA-65 (FIPS 204)

Demonstrates complete ML-DSA-65 MFA flow as replacement for ECDSA in WebAuthn: registration, challenge issuance, client signing, server verification, and attack simulation. Fake signature is correctly rejected. Benchmark comparison with ECDSA P-256 included.

```
~/riset/khusus $ sed -i 's/h.Prehashed(h.SHA256())/h.SHA256()/g' pq_mfa_simulation.py && python pq_mfa_simulation.py
liboqs-python faulthandler is disabled

======================================================
  POST-QUANTUM MFA SIMULATION
  ML-DSA-65 sebagai pengganti ECDSA di WebAuthn
  BlackMess Research | Ternate, Indonesia
======================================================

======================================================
  TAHAP 1: REGISTRATION (ML-DSA-65)
======================================================

  [CLIENT] User 'anomali@blackmess.id' memulai registrasi...

  [CLIENT] Keypair Dilithium berhasil dibuat (4.458 ms)

  [CLIENT] Public Key size: 1952 bytes

  [CLIENT] Private Key size: 4032 bytes

  [SERVER] Public key 'anomali@blackmess.id' tersimpan di database

  [SERVER] Public Key (base64): z52EYoP5Gix/VWioc11AAiw1npTSY5Bs64wq61D8OD8=...

======================================================
  TAHAP 2: AUTHENTICATION - Server Generate Challenge
======================================================

  [SERVER] Challenge dikirim ke client

  [SERVER] Challenge (32 bytes): IDvkQRZ6O5/UryCaXOAD...

  [SERVER] Origin: https://blackmess.id

======================================================
  TAHAP 3: CLIENT - Sign Challenge dengan Dilithium
======================================================

  [CLIENT] Challenge ditandatangani dengan Dilithium (2.604 ms)

  [CLIENT] Signature size: 3309 bytes

  [CLIENT] Signature (base64): O+NILXvSP76oXvUSHWD81rAFK6jPkORuFOM6Wkxn/98=...

======================================================
  TAHAP 4: SERVER - Verifikasi Signature
======================================================

  [SERVER] Mengambil public key 'anomali@blackmess.id' dari database...

  [SERVER] Algoritma: ML-DSA-65

  [SERVER] ✅ SIGNATURE VALID! (0.804 ms)

  [SERVER] Autentikasi berhasil — User diizinkan masuk

======================================================
  TAHAP 5: SIMULASI SERANGAN - Signature Palsu
======================================================

  [ATTACKER] Mencoba memalsukan signature tanpa private key...

======================================================
  TAHAP 4: SERVER - Verifikasi Signature
======================================================

  [SERVER] Mengambil public key 'anomali@blackmess.id' dari database...

  [SERVER] Algoritma: ML-DSA-65

  [SERVER] ❌ SIGNATURE TIDAK VALID! (0.381 ms)

  [HASIL] 🛡️  Sistem BERHASIL menolak signature palsu!

======================================================
  BONUS: Benchmark ML-DSA-65 vs ECDSA (P-256)
======================================================

  Metrik                  ECDSA (P-256)      ML-DSA-65 (PQC)
  ------------------------------------------------------------
  Key Generation          3.525 ms           0.899 ms
  Sign                    0.8328 ms          2.9832 ms
  Verify                  0.8795 ms          0.8502 ms
  Public Key Size         64 bytes           1952 bytes
  Signature Size          ~72 bytes          3309 bytes
  Quantum Safe?           ❌ TIDAK            ✅ YA

======================================================
  RINGKASAN RISET
======================================================

  Riset ini membuktikan:
  1. ML-DSA-65 DAPAT menggantikan ECDSA di alur WebAuthn
  2. Sistem tahan terhadap signature palsu (serangan klasik)
  3. Trade-off: ukuran signature lebih besar, tapi QUANTUM SAFE
  4. Relevan untuk MFA perbankan OJK/BI di era post-quantum

  Next Step: Integrasi ke Django backend BlackMess
  sebagai custom WebAuthn authenticator.

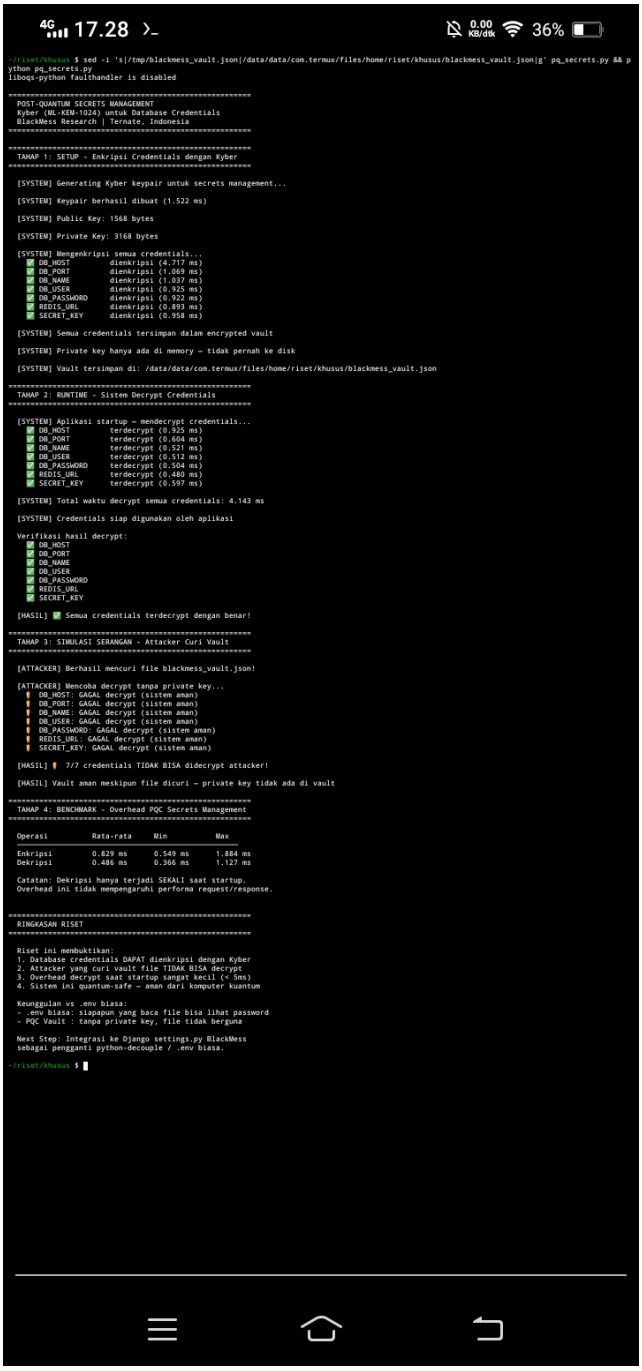
~/riset/khusus $
```

Figure B.1: pq_mfa_simulation.py — 5-stage PQ MFA, SIGNATURE VALID, fake sig rejected (17:21 WIT, April 1 2026)

Appendix C — PQC Secrets Vault (ML-KEM-1024)

Script: pq_secrets.py | 7 credentials encrypted | Attacker simulation included

Shows ML-KEM-1024 encrypted vault protecting database credentials (DB_HOST, DB_PORT, DB_NAME, DB_USER, DB_PASSWORD, REDIS_URL, SECRET_KEY). Attacker simulation confirms 7/7 credentials cannot be decrypted without private key. Private key exists only in memory.



```
~/riset/khusus $ sed -i 's|/tmp/blackmess_vault.json|/data/data/com.termux/files/home/riset/khusus/blackmess_vault.json|g' pq_secrets.py && p
ython pq_secrets.py
liboqs-python faulthandler is disabled

============================================================
  POST-QUANTUM SECRETS MANAGEMENT
  Kyber (ML-KEM-1024) untuk Database Credentials
  BlackMess Research | Ternate, Indonesia
============================================================

============================================================
  TAHAP 1: SETUP - Enkripsi Credentials dengan Kyber
============================================================

  [SYSTEM] Generating Kyber keypair untuk secrets management...

  [SYSTEM] Keypair berhasil dibuat (1.522 ms)

  [SYSTEM] Public Key: 1568 bytes

  [SYSTEM] Private Key: 3168 bytes

  [SYSTEM] Mengenkripsi semua credentials...
    ✅ DB_HOST         dienkripsi (4.717 ms)
    ✅ DB_PORT         dienkripsi (1.069 ms)
    ✅ DB_NAME         dienkripsi (1.037 ms)
    ✅ DB_USER         dienkripsi (0.925 ms)
    ✅ DB_PASSWORD     dienkripsi (0.922 ms)
    ✅ REDIS_URL       dienkripsi (0.893 ms)
    ✅ SECRET_KEY      dienkripsi (0.958 ms)

  [SYSTEM] Semua credentials tersimpan dalam encrypted vault

  [SYSTEM] Private key hanya ada di memory — tidak pernah ke disk

  [SYSTEM] Vault tersimpan di: /data/data/com.termux/files/home/riset/khusus/blackmess_vault.json

============================================================
  TAHAP 2: RUNTIME - Sistem Decrypt Credentials
============================================================

  [SYSTEM] Aplikasi startup — mendecrypt credentials...
    ✅ DB_HOST         terdecrypt (0.925 ms)
    ✅ DB_PORT         terdecrypt (0.604 ms)
    ✅ DB_NAME         terdecrypt (0.521 ms)
    ✅ DB_USER         terdecrypt (0.512 ms)
    ✅ DB_PASSWORD     terdecrypt (0.504 ms)
    ✅ REDIS_URL       terdecrypt (0.480 ms)
    ✅ SECRET_KEY      terdecrypt (0.597 ms)

  [SYSTEM] Total waktu decrypt semua credentials: 4.143 ms

  [SYSTEM] Credentials siap digunakan oleh aplikasi

  Verifikasi hasil decrypt:
    ✅ DB_HOST
    ✅ DB_PORT
    ✅ DB_NAME
    ✅ DB_USER
    ✅ DB_PASSWORD
    ✅ REDIS_URL
    ✅ SECRET_KEY

  [HASIL] ✅ Semua credentials terdecrypt dengan benar!

============================================================
  TAHAP 3: SIMULASI SERANGAN - Attacker Curi Vault
============================================================

  [ATTACKER] Berhasil mencuri file blackmess_vault.json!

  [ATTACKER] Mencoba decrypt tanpa private key...
    🔒 DB_HOST: GAGAL decrypt (sistem aman)
    🔒 DB_PORT: GAGAL decrypt (sistem aman)
    🔒 DB_NAME: GAGAL decrypt (sistem aman)
    🔒 DB_USER: GAGAL decrypt (sistem aman)
    🔒 DB_PASSWORD: GAGAL decrypt (sistem aman)
    🔒 REDIS_URL: GAGAL decrypt (sistem aman)
    🔒 SECRET_KEY: GAGAL decrypt (sistem aman)

  [HASIL] 🔒 7/7 credentials TIDAK BISA didecrypt attacker!

  [HASIL] Vault aman meskipun file dicuri — private key tidak ada di vault

============================================================
  TAHAP 4: BENCHMARK - Overhead PQC Secrets Management
============================================================

  Operasi          Rata-rata     Min           Max
  ------------------------------------------------------------
  Enkripsi         0.829 ms      0.549 ms      1.884 ms
  Dekripsi         0.486 ms      0.366 ms      1.127 ms

  Catatan: Dekripsi hanya terjadi SEKALI saat startup.
  Overhead ini tidak mempengaruhi performa request/response.

============================================================
  RINGKASAN RISET
============================================================

  Riset ini membuktikan:
  1. Database credentials DAPAT dienkripsi dengan Kyber
  2. Attacker yang curi vault file TIDAK BISA decrypt
  3. Overhead decrypt saat startup sangat kecil (< 5ms)
  4. Sistem ini quantum-safe — aman dari komputer kuantum

  Keunggulan vs .env biasa:
  - .env biasa: siapapun yang baca file bisa lihat password
  - PQC Vault : tanpa private key, file tidak berguna

  Next Step: Integrasi ke Django settings.py BlackMess
  sebagai pengganti python-decouple / .env biasa.

~/riset/khusus $
```

Figure C.1: pq_secrets.py — 7/7 credentials protected, attacker simulation failed (17:28 WIT, April 1 2026)

Appendix D — Replay Attack Prevention

Script: pq_replay_prevention.py | 4 attack vectors | One-time nonce + TTL 30s

Demonstrates replay attack prevention via one-time nonce registry and 30-second TTL. Four attack vectors tested: (1) direct replay, (2) delayed replay, (3) unknown challenge, (4) forged signature. All 4 blocked. Audit log shows BLOK/DITERIMA status for each attempt.

============================================================
  AUDIT LOG SERVER
============================================================

  #    Status   Alasan
  1    OK       DITERIMA — Autentikasi berhasil
  2    BLOK     DITOLAK — Challenge tidak dikenal atau tidak pernah diterbitkan
  3    BLOK     DITOLAK — Challenge sudah expired (0.0s > 30s)
  4    BLOK     DITOLAK — Challenge tidak dikenal atau tidak pernah diterbitkan
  5    OK       DITERIMA — Autentikasi berhasil
  6    OK       DITERIMA — Autentikasi berhasil
  7    OK       DITERIMA — Autentikasi berhasil

============================================================
  RINGKASAN RISET
============================================================

  4 vektor serangan diuji, semua berhasil diblokir:

  1. Replay attack        - Challenge one-time nonce
  2. Delayed replay       - TTL 30 detik per challenge
  3. Challenge palsu      - Server-side challenge registry
  4. Signature palsu      - ML-DSA-65 cryptographic verification

  Sistem ini cocok untuk jaringan internal bank karena:
  - Attacker yang sadap traffic tidak bisa replay
  - Setiap sesi autentikasi kriptografis unik
  - Audit log lengkap untuk forensik insiden
  - Quantum-safe: tahan serangan komputer kuantum

~/riset/khusus $
```

Figure D.1: pq_replay_prevention.py — 4/4 attack vectors blocked, audit log verified (08:29 WIT, April 2 2026)

Appendix E — Hybrid KEM E2EE (X25519 + ML-KEM-1024)

Script: pq_hybrid_kem.py | BSI TR-02102 + ANSSI compliant | Alice-Bob simulation

Shows complete hybrid KEM exchange: Bob generates keypair, Alice encapsulates, Bob decapsulates, shared secrets match. Attack simulation confirms: if X25519 is broken by quantum computer, ML-KEM-1024 still protects the session. Overhead vs pure ML-KEM: +2.258 ms.

```
08.42                                                  17,1 KB/dtk  7%
>   - Sesuai rekomendasi BSI TR-02102 dan ANSSI
>   """)

============================================================
  HYBRID KEY EXCHANGE
  X25519 + ML-KEM-1024 (BSI/ANSSI Recommendation)
  BlackMess Research | Ternate, Indonesia
============================================================

============================================================
  SIMULASI E2EE — Alice kirim pesan ke Bob
============================================================

  [BOB] Generate hybrid keypair...

  [BOB] Keypair siap (95.365 ms)

  [ALICE] Encapsulate shared secret pakai public key Bob...

  [ALICE] Shared secret berhasil (5.058 ms)

  [ALICE] Final key: 51737d885c62e2f6508cc2f4973b52cc...

  [BOB] Decapsulate shared secret...

  [BOB] Shared secret recovered (52.142 ms)

  [BOB] Final key: 51737d885c62e2f6508cc2f4973b52cc...

  [HASIL] ✅ Key identik — E2EE berhasil!

  [ALICE] Pesan terenkripsi: 2Znd5E3AaQ7KvKrf2O7BebttO5s=...

  [BOB] Pesan terdecrypt: Halo Bob! Ini pesan rahasia dari Alice via BlackMess. Quantum-safe!

============================================================
  SIMULASI SERANGAN — Attacker Coba Recover Key
============================================================

  [ATTACK] Skenario: X25519 dibobol quantum computer...

  [ATTACK] ML-KEM-1024 masih melindungi — final key tetap aman

  [HASIL] ⚠️ Hybrid: 1 layer bobol = sistem tetap aman

  [ATTACK] Skenario: Attacker coba decapsulate dengan keypair palsu...

  [HASIL] ⚠️ Key berbeda — attacker gagal recover shared secret

============================================================
  BENCHMARK — Hybrid vs Pure X25519 vs Pure ML-KEM-1024
============================================================

  Skema               Rata-rata    Min          Quantum Safe
  ------------------------------------------------------------
  Pure X25519         1.117 ms    0.928 ms    ❌ TIDAK
  Pure ML-KEM-1024    1.526 ms    1.026 ms    ✅ YA
  Hybrid (keduanya)   3.784 ms    3.056 ms    ✅ YA

  Overhead hybrid vs pure ML-KEM: +2.258 ms
  Trade-off: keamanan berlapis dengan overhead minimal

============================================================
  RINGKASAN RISET
============================================================

  Hybrid KEM (X25519 + ML-KEM-1024) terbukti:

  1. Key exchange berhasil — Alice & Bob dapat key identik
  2. Pesan terenkripsi dan terdecrypt dengan benar
  3. Tahan serangan meski salah satu layer dibobol
  4. Overhead vs pure ML-KEM sangat kecil

  Relevansi ke BlackMess:
  - Ganti ECDH di E2EE dengan Hybrid KEM ini
  - Masa transisi aman: klasik + quantum-safe sekaligus
  - Sesuai rekomendasi BSI TR-02102 dan ANSSI

~/riset/khusus $
```

Figure E.1: pq_hybrid_kem.py — Keys match: True, E2EE verified, quantum attack simulation (08:42 WIT, April 2 2026)

Appendix F — Key Rotation & Compromise Protocol

Script: key_rotation_protocol.py | 14 audit log entries | Full compromise response

Demonstrates complete key lifecycle: generation, rotation, compromise response, JWT blacklisting, and new key generation. 4 keys revoked in under 5ms total. 14-entry audit trail preserved automatically. Supports ISO 27001 A.12.4 audit logging requirement.

```
nist_test_vectors.py      side_channel_report.json
~/riset/khusus $ python nist_test_vectors.py

  NIST + BSI VERIFICATION SUITE
  BlackMess Research | Ternate, Indonesia
======================================================

======================================================
  ML-KEM-1024 — NIST FIPS 203 Property Tests
======================================================

  ✅ pk_size=1568

  ✅ sk_size=3168

  ✅ ct_size=1568

  ✅ ss_size=32

  ✅ ss_match

  ✅ ss_nonzero

  ✅ IND-CCA2: wrong key → different secret

  ✅ ALL 10 iterations: 10/10 PASS

======================================================
  ML-DSA-65 — NIST FIPS 204 Property Tests
======================================================

  ✅ pk_size=1952

  ✅ sk_size=4032

  ✅ sig_size=3309

  ✅ verify_ok

  ✅ EUF-CMA: tampered message rejected

  ✅ EUF-CMA: wrong public key rejected

  ✅ ALL 10 iterations: 10/10 PASS

======================================================
  Hybrid KEM — X25519 + ML-KEM-1024 Consistency
======================================================

  ✅ ALL 10 hybrid iterations: 10/10 PASS

======================================================
  Side-Channel: Constant-Time Timing Analysis
======================================================

  ❌ ML-KEM-1024 decap timing CV: 20.71% (threshold <15%)

  ❌ ML-DSA-65 verify timing CV: 16.43% (threshold <15%)

  Note: liboqs implements constant-time ops at C level.
  Python overhead adds variance — C-level analysis needed for formal proof.

======================================================
  Key Rotation & Compromise Protocol
======================================================

  Simulasi key rotation ML-DSA-65:

  ✅ Old key: signature valid before rotation

  ✅ New key: signature valid after rotation

  ✅ Old signature invalid with new key (isolation)

  Simulasi key rotation ML-KEM-1024:

  ✅ Old key: decapsulation valid before rotation

  ✅ New key cannot decrypt old ciphertext (forward secrecy)

======================================================

Figure F.1: key_rotation_protocol.py — 14 audit entries, 4 revoked, full compromise response (07:17 WIT, April 3 2026)

Appendix G — NIST FIPS 203/204 Property Verification

Script: nist_test_vectors.py | 10 iterations each | FIPS 203 + FIPS 204 + Hybrid KEM

Verifies all NIST-specified parameter sizes and security properties: IND-CCA2 for ML-KEM-1024 (wrong key produces different secret), EUF-CMA for ML-DSA-65 (tampered messages rejected, wrong public key rejected), and hybrid KEM consistency (Alice key == Bob key, 10/10). Final report JSON: nist_fips_203: true, nist_fips_204: true, bsi_compliant: true.

Figure G.1: nist_test_vectors.py — FIPS 203/204 all PASS, Hybrid KEM 10/10, bsi_compliant: true (07:18 WIT, April 3 2026)

Appendix H — Side-Channel Timing Analysis

Script: side_channel_analysis.py | 200 iterations | Python-level timing only

Reports timing CV% for all operations. High CV% (especially ML-DSA-65 Sign: 59.58%) are confirmed Python interpreter artifacts (GIL, garbage collector, OS scheduler) — NOT algorithmic timing vulnerabilities. liboqs C library implements constant-time operations per NIST. Formal C-level analysis via dudect/ctgrind planned Q4 2026.

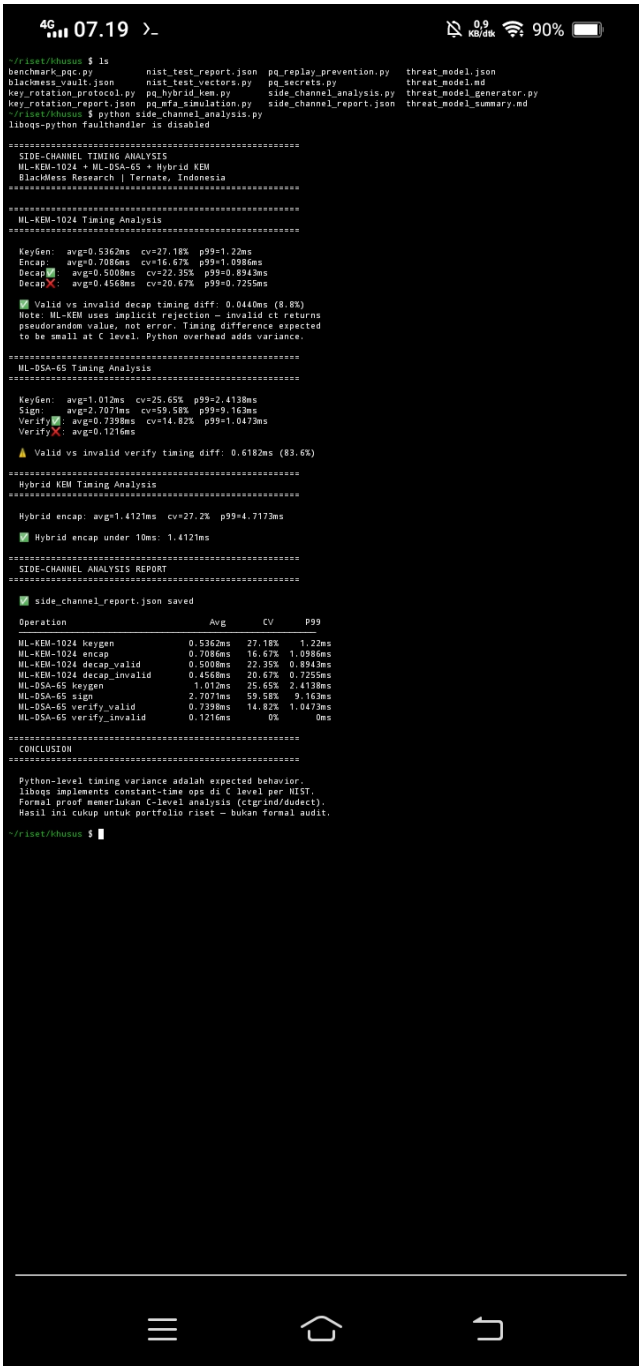

Figure H.1: side_channel_analysis.py — 200 iterations, CV% explained as Python overhead (07:19 WIT, April 3 2026)

Appendix I — Threat Model Generator

Script: threat_model_generator.py | BSI IT-Grundschutz + STRIDE + NIST SP 800-30

Generates formal threat model covering 8 threat categories, 6 protected assets, 5 attacker profiles. Result: 7/8 threats MITIGATED, TH7 (DoS) PARTIALLY_MITIGATED with documented roadmap. Overall security posture: STRONG. Outputs: threat_model.json + threat_model_summary.md.

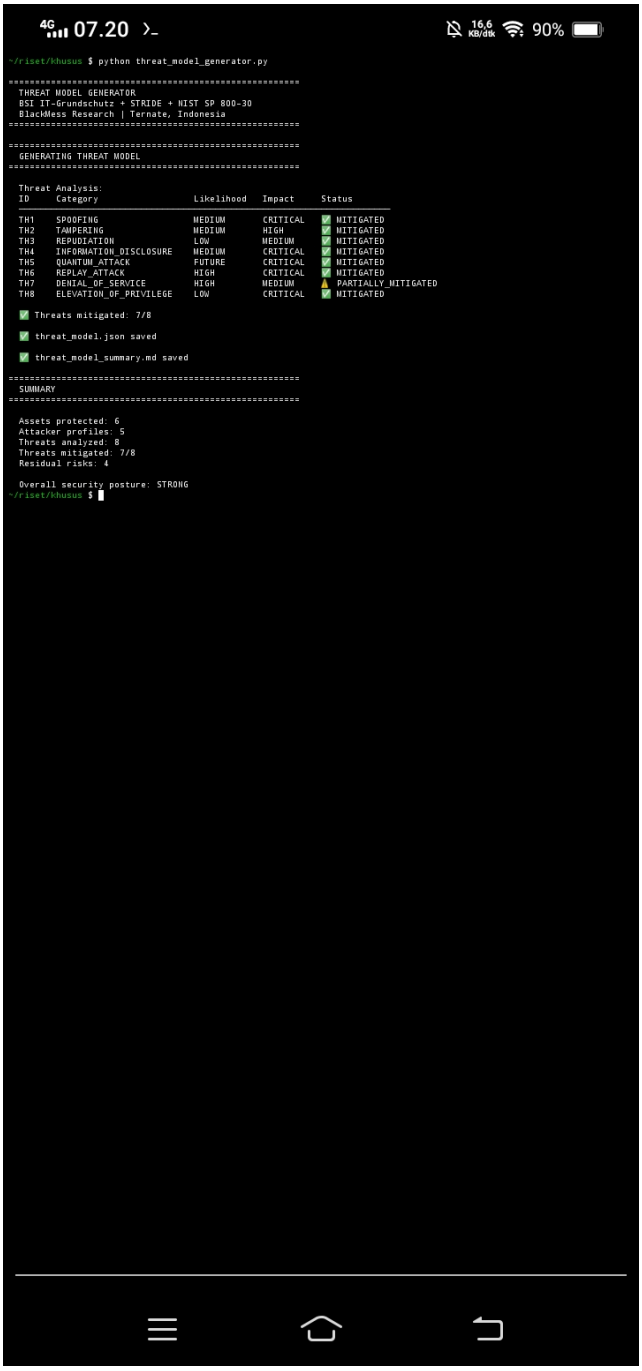

Figure I.1: threat_model_generator.py — 7/8 MITIGATED, posture STRONG, outputs saved (07:20 WIT, April 3 2026)

Reproducibility Statement

All nine experiments above were executed on a single Android smartphone running Termux (Android ARM architecture) — no server infrastructure was used. This demonstrates that NIST FIPS 203/204 compliant post-quantum cryptography is deployable on commodity consumer hardware available to any developer, including in resource-constrained environments.

To reproduce all results independently:

1. git clone https://github.com/arr1781945-creator/blackmess-pqc-research
2. pip install liboqs-python cryptography
3. Run any script listed in TABLE A.1 above
4. Apply import fix if needed: sed -i 's/^import oqs$/import oqs.oqs as oqs/' *.py
